Hackathon Judging Criteria – Who Stays On?

Participants will be evaluated based on the following criteria:

1. **Roster Correctness:** How accurately the solution generates schedules while following all given rules and constraints.
2. **Value Served:** How effectively the solution maximizes the total value served within the available resources.
3. **Robustness:** How well the application handles unexpected updates, boundary cases, infeasible scenarios, and invalid inputs.
4. **Personal Understanding:** A randomly selected team member will participate in a short live evaluation to explain the solution, predict outcomes when constraints change, and justify scheduling decisions and trade-offs.
5. **Working Application:** The application must run offline, respond correctly to API requests, and clearly display schedules, loads, fuel consumption, and decision explanations.
6. **Verification Evidence:** Teams must demonstrate their own testing process, including identifying and fixing an issue and verifying boundary conditions.

Important Notes:

- AI tools are allowed, but their use does not directly contribute to the evaluation.
- Solutions will be tested using hidden inputs.
- Teams must be able to explain and justify their implementation and results.
- During the live evaluation, the selected team member must answer independently without assistance from teammates.
